1 Bipolar-based circuits

1.1 Common emitter

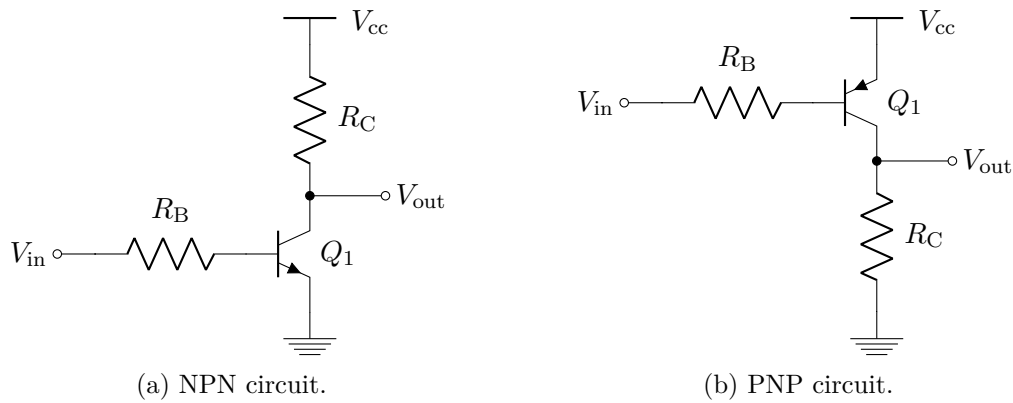

Figure 1.1: Common emitter bipolar transistor, with direct coupling at input.

Figure 1.2: Common emitter bipolar NPN transistor polarized by current injection to the base, with capacitive coupling at input.

1.2 Common collector

1.3 Common base

1 Bipolar-based circuits

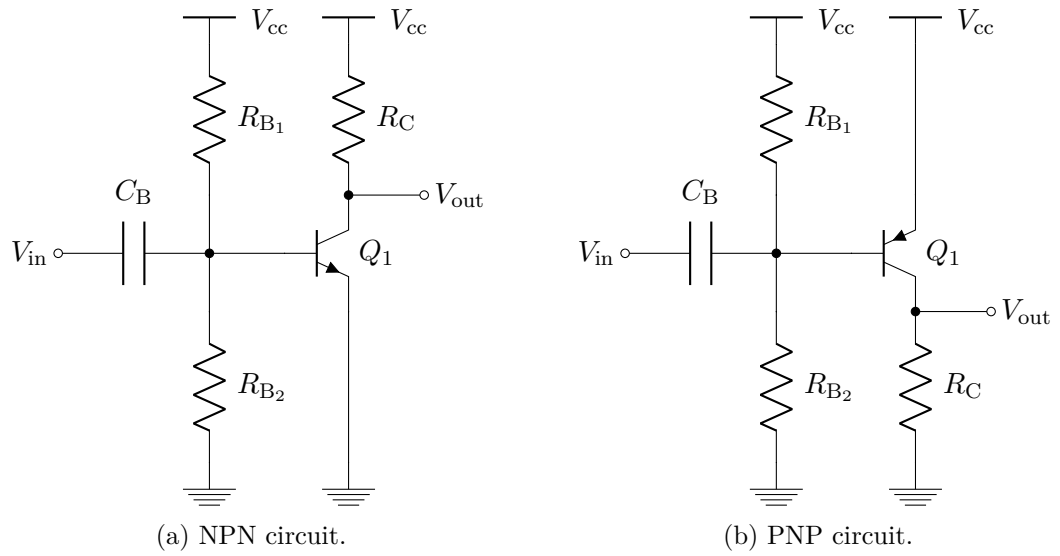

Figure 1.3: Common emitter bipolar transistor polarized by a resistive divider, with capacitive coupling at input.

Figure 1.4: Common collector bipolar transistor, with direct coupling at input.

2 CMOS-based circuits

2.1 Common source

Figure 2.1: Common source CMOS transistor, with direct coupling at input.

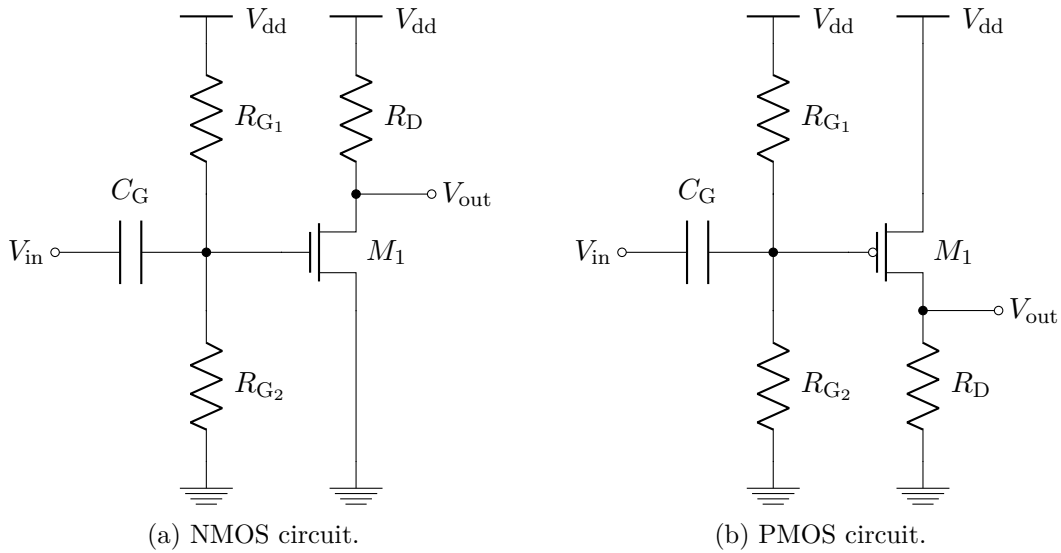

Figure 2.2: Common source CMOS transistor polarized by a resistive divider, with capacitive coupling at input.

2.2 Common drain

Figure 2.3: Common drain CMOS transistor, with direct coupling at input.

2.3 Common gate

3 Operational amplifier based circuits

3.1 Basic stages

Basic stages include:

- the follower (fig. 3.1),
- the inverting amplifier (fig. 3.2a), and
- the non-inverting amplifier (fig. 3.2b).

Figure 3.1: Follower amplifier.

3.2 Electrical arithmetic operators

3.3 First order active filters

First order active filters include low-pass and high-pass filters, either with infinite (fig. 3.4) or limited (fig. 3.5) gain.

3 Operational amplifier based circuits

Figure 3.2: Amplifiers.

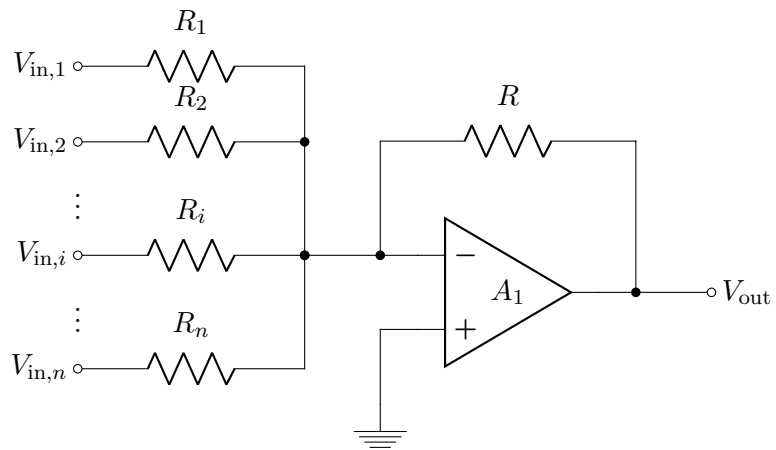

Figure 3.3: Voltage sum.

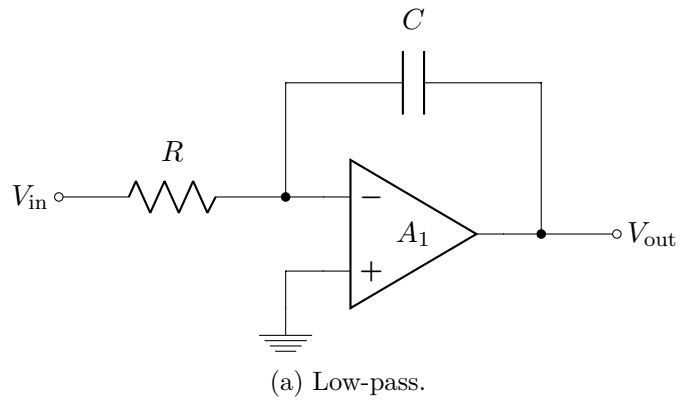

Figure 3.4: First order active filters op amps architectures with infinite gain.

3 Operational amplifier based circuits

Figure 3.5: First order active filters op amps architectures with limited gain.
